Swarm behaviour

particularly those by species of dragonflies, beetles, butterflies, and moths. The distance can vary from species to species, but in most cases these movements - Swarm behaviour, or swarming, is a collective behaviour exhibited by entities, particularly animals, of similar size which aggregate together, perhaps milling about the same spot or perhaps moving en masse or migrating in some direction. It is a highly interdisciplinary topic.

As a term, swarming is applied particularly to insects, but can also be applied to any other entity or animal that exhibits swarm behaviour. The term flocking or murmuration can refer specifically to swarm behaviour in birds, herding to refer to swarm behaviour in tetrapods, and shoaling or schooling to refer to swarm behaviour in fish. Phytoplankton also gather in huge swarms called blooms, although these organisms are algae and are not self-propelled the way most animals are. By extension, the term "swarm" is applied also to inanimate entities which exhibit parallel behaviours, as in a robot swarm, an earthquake swarm, or a swarm of stars.

From a more abstract point of view, swarm behaviour is the collective motion of a large number of self-propelled entities. From the perspective of the mathematical modeller, it is an emergent behaviour arising

from simple rules that are followed by individuals and does not involve any central coordination. Swarm behaviour is also studied by active matter physicists as a phenomenon which is not in thermodynamic equilibrium, and as such requires the development of tools beyond those available from the statistical physics of systems in thermodynamic equilibrium. In this regard, swarming has been compared to the mathematics of superfluids, specifically in the context of starling flocks (murmuration).

Swarm behaviour was first simulated on a computer in 1986 with the simulation program boids. This program simulates simple agents (boids) that are allowed to move according to a set of basic rules. The model was originally designed to mimic the flocking behaviour of birds, but it can be applied also to schooling fish and other swarming entities.

List of Emily Dickinson poems

signature of 2 leaves and 4 pages), laid on top of each other (not nested), and bound with string. Other poems are preserved in what R. W. Franklin calls - This is a list of poems by Emily Dickinson. In addition to the list of first lines which link to the poems' texts, the table notes each poem's publication in several of the most significant collections of Dickinson's poetry—the "manuscript books" created by Dickinson herself before her demise and published posthumously in 1981; the seven volumes of poetry published posthumously from 1890 to 1945; the cumulative collections of 1924, 1930, and 1937; and the scholarly editions of 1955 and 1998.

Important publications which are not represented in the table include the 10 poems published (anonymously) during Dickinson's lifetime; and editions of her letters, published from 1894 on, which include some poems within their texts. In all these cases, the poem itself occurs in the list, but these specific publications of the poem are not noted.
